

Flipkart E-Commerce Platform Analysis

Chapter -1

1.1 Introduction

Flipkart is one of India's leading e-commerce platforms. It enables customers to purchase products such as electronics, fashion, home appliances, groceries, and more through its website and mobile application. Flipkart connects millions of buyers with sellers and provides secure payment options, fast delivery, and easy return policies. This project analyzes Flipkart's business model, features, and working process.

1.2 Problem statement

Traditional shopping requires customers to visit physical stores, which can be time-consuming and may offer limited product choices. Customers also face difficulties in comparing prices, checking product availability, and finding the best deals. Sellers have limited opportunities to reach a large customer base through offline stores alone.

An e-commerce platform like Flipkart addresses these challenges by providing a convenient online marketplace where customers can browse products, compare prices, make secure payments, track orders, and request returns or refunds. This project analyzes how Flipkart's platform works and how it improves the online shopping experience for both customers and sellers.

1.3 Objective

- To study the working process of the Flipkart e-commerce platform.
- To understand how customers, sellers, and administrators interact with the system.
- To analyze the online shopping workflow, from product search to order delivery.
- To understand the business, functional, and non-functional requirements of an e-commerce platform.
- To study the role of databases in managing users, products, orders, payments, and inventory.
- To analyze the data flow and system architecture of Flipkart.
- To gain practical knowledge of how real-world e-commerce platforms operate.

1.4 Motivation of the Project

The motivation behind this project is to understand how a successful e-commerce platform works in real life. Flipkart has transformed online shopping in India by offering a wide range of products, secure transactions, and efficient delivery services.

1.5 Stakeholders

- ★ Customers
- ★ Sellers/Vendors
- ★ Flipkart Admin
- ★ Delivery Partners
- ★ Payment Gateway Providers
- ★ Customer Support Team

1.6 Business Requirements

- ★ Allow customers to browse and purchase products online.
- ★ Enable sellers to list and manage products.
- ★ Provide secure online payment options.
- ★ Ensure timely order processing and delivery.
- ★ Maintain customer satisfaction through easy returns and refunds.
- ★ Generate sales reports and business analytics.

1.7 Functional Requirements

- ★ User registration and login.
- ★ Product search and category browsing.
- ★ Product details with images and prices.
- ★ Add to cart and wishlist.
- ★ Place orders and make payments.
- ★ Order tracking.
- ★ Product reviews and ratings.
- ★ Return and refund requests.
- ★ Admin management of users, products, and orders.

1.8 Non-Functional Requirements

- ★ Performance: Pages should load quickly.
- ★ Security: Protect user accounts and payment information.
- ★ Reliability: The system should be available most of the time.
- ★ Scalability: Handle a large number of users and orders.
- ★ Usability: Easy-to-use interface for customers and sellers.
- ★ Availability: Service should be accessible 24/7.
- ★ Maintainability: Easy to update and fix issues.
- ★ Compatibility: Work on mobile devices, tablets, and web browsers.
